

## CLINOSTOP

### CONTROL OF MYCOSIS

#### ENVIRONMENTAL SANITIZER

Contains: E.O. Eucalyptus

#### DESCRIPTION

CLINOSTOP is a product designed for intensive rabbit farming, the p.a. contents allow to contain skin fungal infections (cutaneous mycosis or dermatophytosis).

The cutaneous mycoses that affect farms cause considerable economic damage and causing lesions such as: alopecic areas, scaly and flaky skin, reduce performance and are a vehicle for secondary diseases caused by bacteria and viruses. Often the disease recurs and if not controlled it can spread to the whole farm.

- Control of cutaneous mycosis or dermatophytosis

#### ACTION

CLINOSTOP fights the vegetative forms and slows down the spore-forming forms of the fungi of the main fungal forms responsible for cutaneous mycoses. The use of CLINOSTOP in the preparation of nests allows for a good sanitation which will manifest itself with healthy weaners, free from cutaneous mycosis, soft and dry nests.

Environmental distribution allows the product to perform a residual action due to a "multi-active" formula, consisting of ingredients that release their active ingredient gradually.

#### DOSAGE

Nests: Distribute 5/10g. of product as it is in the preparation phase.

Subsequently, after the development of the hair, distribute 5 / 10g. of product as it is, directly on the broods.

Repeat every 5/7 days. as needed.

Environment: Dry spray 1 kg of product as it is every 200sqm. of surface.

Repeat once every 5/7 days. as needed.

Dosages may vary depending on the health situation of the farm.

The technical service is available to recommend the dosage.

#### PACKAGES

Available in bags of 25 kg

Store in a cool and dry place, away from heat sources.

Not subject to expiration.
