

GARLICON L170

TECHNOLOGICAL PHYTOTHERAPY LIQUID

COMPLEMENTARY FEED FOR ALL SPECIES

Ingredients:

propylene glycol, glycerol

Additives per kg:

Organoleptic additives (mix of flavouring substances): 210,750 mg/kg.

Emulsifier: glycerin ricinoleate polyethylene glycol (E-484): 42,600 mg.

DESCRIPTION

Garlicon is not a phytotherapeutic additive, it is the result of years of biotechnological research carried out in Spain on the extraction and stabilization of active ingredients derived from Alliaceae - *DOMCA s.a.* It comes as a sensory and technological additive designed to modulate the gut ecosystem of farm animals by acting as a powerful eubiotic.

ACTION

Garlicon has strong activity against intestinal pathogenic bacteria. It modulates the positive bacterial flora, its metabolic activity manifests itself throughout the intestinal tract.

Unlike raw or refined extracts from garlic, Garlicon guarantees:

- Standardization: Each gram of product contains an exact and constant concentration of active ingredients.
- Thermostability: it resists feed pelleting processes (up to 80-90°C), a critical factor in industrial poultry farming.
- Specific target: thanks to its stability, the molecules arrive intact in the posterior (blind) intestinal districts, where the pressure of pathogens is higher.

DOSAGE

Piglets prestarter phase (from 21 to 42 days) gr. 20-60 per 100L of water

Fattening pigs and sows: gr. 20-600 per 100L of water

Poultry: gr. 5-30 per 100L of water

Rabbits: gr.20-50 per 100L of water

Dosages may vary depending on the health situation of the farm.

The technical service is available to advise on the dosage.

PACKAGING

Available in 5 kg tanks in boxes of 6 pcs.

Store in a cool, dry place, away from heat sources.

To be consumed within 18 months from the date of production.

FAMI-QS Certificate

Rev.1-26
